## CZECHOSLOVAK TEXTILE INDUSTRY.

Besides machine and tannery industry the textile industry is the largest industrial branch in the CSR. The production is so big because it was established for supplying the whole Austrian Empire with textile goods. After the dissolution of this monarchy it was obliged to look for new markets abroad and it remained the largest exporting industry even after the W.W.II. Only export of textile helps Czechoslovakia in acquiring foreign currency and although the exported products contain cca 50% raw-materials purchased for foreign currency, it has been up to the present one of the most important industries in the country.

The textile industry is located in several places in the CSR, mostly in montaneous parts of the country where it gradually developed from home work on looms. The good call of Czechoslovak textile industry abroad was based on the tradition of these homeworking weavers whose craft was inherited from generation to generation and grew finally into large factory interprises. One of the largest centers of the textile industry is the area of MACHED (051/G 93), i.e. from the OMLICE mountains in a nearly coherent stripe over the towns ERCNOV (051/6 94), POLICE(051/H 04), ACTUREV (PS1/H 05), TRUTHOV(051/G 74), DVUR KR/LOVE(051/G 73), LOSTER(051/H09), PAKA(051/G 53), JILEMNICE(051/G L5), VYSOKE NAD JIZEROU, TAKEMAID (051/G 36), over LIREREC (051/G 16), JAPLONNE NAD JIZEROU(051/7 96) as far as VARNSDORF(051/F 87). In this region mostly cotton, flax and jute is being worked up. At LIEEREC it goes over to wool industry. and ends at VARNSDORF with hosiery. At the time of full employments of all inhabitants worked with the textile industry. In this region, besides several immense spinning mills, a great number of weaveries, dying factories, factories for bleaching, dressing (upravny), for hackling flax as well as several printeries and plants producing carpets, knitted goods and stockings.

The second large textile area extends from HUMPOLEC (050/M 53) and HILINSKO(050/M 86) through JIHLAVA(050/L 61) to Moravia and works mostly on wools.

Large wool industry is also located in BRNO and the Moravian area of cotton industry is concentrated in the vicinity of FRYDEK-MISTEK (Q50/0 67). Flax is being worked up in Moravia in the environs of ERUNTAL(P50/N 99) and goes over into silk industry at SUMPERK(P50/N69) ZAEREH(P50/N 58) and CERVENA VODA(P51/N h9) and continues into Echemia through KYSPERK, VARMERG(051/H 00), RYCHNOV(C51/H 00) and DOBRUSKA(051/G 92) where it is connected with the mentioned NACHOD area.

Further textile area, connected with that af KRKONOSE mountains (Riesengebirge) is the one extending from USTI NAD LAREN(N51/F hll), up to MOST(N51/F 13) and further through KRUSNE HORY mountains (Erzgebirge) and further through NEJDEK(N51/K 50), SLANY(N51/F 50) and reaches as far as KRASLICE(N51/K 30) and AS(M51/P 18). Production of fesses is in STRAKONICE(N50/Q h9) and manufacture of hats from

animal hair is in Moravia, near MOVI JICIM(P50/0 hs). To these old textile wenters were attached factories founded by the Bata firm in TREBEC(050/M 90) and ZLIM(P50/0 21) where socks and stockings and shoe-laces are being preduced, as well as cords for tires(kordy) and necessary textile for shoe production.

An old textile center in Slovakia is in EUZOMBEROK (Q50/C 99) and TRENCIN (PL9/T 58) and new Bata factories were founded at BATISOVCE near POTRAD (Q50/D 68) and at present, new textile factories are being built at LIPTOVSKY Sv.MIKULAS (Q50/D 19).

In order to acquire necessities for this large textile industry which employed in the whole Republic sca 600.000 people, large auxiliary industry gradually grew up, as production of textile machinery in LIBEREC area, at TYNISTE(050/K 36) and in ERNO. Production of various necessities for the wearing and spinning industry is at JAROMER(051/G 82) and at USTI NAD ORLICI(.

The large chemical industry which besides basic chemical matters (lyes, acids, soda) produced colours and auxiliary textile substances was concentrated mainly at USTI NAD LAREM, PRAHA, VARNSDORF, RUMBURK(051/F 78), MNISEK near LIBEREC, KOLIN(051/M 38), NOVE MESTO NAD METUJI(051/G 92) and CTASLAVICE near VYSKOV(P50/N 71).

Production of artificial fibres for textile industry is at NERATOVICE (051/F 80), LOVOSICE, ERATISIAVA and SENICE (PL9/T 06) as well as in BATISOVCE.

In principle, all kinds of artificial silk are being produced in the CSR, artificial clip (strix), perlon at BATISOVCE ans personal textile glas-fibres (glas-clip - skelna strix) in the newly founded development enterprise Vertex at HRADEC KRALOVE (051/G 71) with a branch plant at PRICHOVICE (or POLUENY?) near TANNWALD.

Because the Csechoslovak textile industry, located from its major part in germanised area of CSR employed several Germans, it was in a rather difficult situation after 1945 because of lack of trained personnel in result of the benishment of Germans from the CSR. Several confiscated factories came into hends of national administrators, very often without any expert knowledge and after working for some time with permanent losses they had to be liquidated. After the February Communist Comp in 1948 and re-organisation of national corporations, a large-scale liquidation of smaller enterprises took place, especially in Krusne Hory area (Ersenbirge). This was a damage for Caechoslovak textile industry as in this way several very specialised firms (for women dress clothes, hosiery and lecemork) which worked nearly only for export, were liquidated. The national corporations, to which some of the medium-cise factories were attached, also liquidated these factories and from tertical political reasons they are making a large-scale moving of the equipment of these factories from one plant to enother The last stroke for the Csechoelovak textile was the order that 60% of all textile is to be liquidated and its buildings and comployees

are to be transferred to metallurgic industry. It can be presumed that after this re-organization of Goeshoulovak textile industry will employ about 300.000 people but its opposity will still be sufficient for severing the whole Goeshoulovak need and still about the helf of the production will be able to be sold abroad.

The present Coschoslovak textile industry is administrated by the General Management of Textile Industry "Caechoslovak Textile Enterprises (Cosmoslovenske textilni savody - CTZ). Its manager general is Dr. Iven HOLY (mentioned in the repost on Caechoslovak Chemical Industry). The management is located in Prague, Ma Porici 2h in the former building of the Supreme Price Bureas (Nejvyssi ured cenovy) and lately it took over also the neighbouring fullding of the former Bank of Csechoelovak Legion (Banka cs.legii). It has a special section for each part and way of production. Together, it is an immense bureau with about 800 employees. The textile research institutes at BRNO and at DVUR KRALEVE are also subordinated to it. The CTZ supervises besides the primary textile industry also production of carpets, lacework, factory production of suits and dresses. Production of underwear, nationalised milliners and tailors, working up of fur and a special department of light metallurgic production. The different plants are united into national corporations with one leading basic enterprise each. There are very many of these national corporations, for instance: Casehoelevak Spinning Mills of Cotton, national corporation, Juta, national corporation (the basic enterprise is at DVUR KRALOVE), Tibe, national corporation (basic enterprise at DVUR KRALOVE), Osechoelovek Printing and Dying Plants, nat.corp. Production of SILK textiles is formed by the plants: Hedva, national corporation (at SHETHER), Henap, nat.corp. (LIHEREC) and Silks, nat.corp., (at FRIDER) Bat. corp. (at FRIDER - MISTER), Relocat, Set. corp.
(LIBERT), Timer, set. corp. (at LIBERE), Trypes, set. corp. (MACHUE),

biffrom the second file of the street the file of girls and evening the second file of the street the second entering the second file of girls and evening the product the satisfact file of girls, not sith the second file of the second entering entitles. Still september 1950 it her set been decided stick the second of the liquidated on the contrast, all tried to services the respective setherities that the sciences of the plants essented is very important in order to preserve its further existence. As textile industry exported a great deal, now machines term perchance abreed in 1967 - 18, morthly in England and Settmerland. The installation of these machines has not been completed put and that is one of the reasons for objections of against liquidation of such plants. Importally the Slevak Sextile enterprises been of such plants. Importally the Slevak Sextile enterprises been considerably enlarged after the W.W.II and equi pped with may machinery so that they are the next modern ones in the whole country.

The jeint-steck self-titede company CENTRUEN has been entrusted with export of Geschoelovak textile goods and import of the necessary res-enterials, colours, chemical matters and machines. The seat of Centrotex is in Prague 'life palace on Vaclavske nemesti) and has a bymach office in REMO. Because export to the Bust is lesser and lesser the problem of acquiring necessary res-enterial is becoming urgent. Conchectovak textile industry receives from the exestery countries only Emacian wool and cotton, of a very magnal quality but meetly of the worse qualities. The products which export exists are not suitable for export anter the Bust sumeries. The best results is export up to the present that the mitigan's corporation jude which exported beside exports. The still make the mitigan's corporation jude which exported beside exports of the mitigan's corporation jude which exported beside exports of the mitigation of the which conserve which is also import of the mitigation of

which performs often import of comparatively large amounts of chemical matters on the basis of own compensation through Centrotex, often even though such material is produced in the CSR. Up to the present, it was absolutely unevitable to import fixative matters for carboxylalkylockulose colours (Thyloses) and condensation products on the basis of ethylone exide. The production of the last mentioned items has been started lately at NYMINVI (051/M 69) on a small scale (see special reports).

Quality of the Csechoslovak textile after W.W.II was much lower than it used to be previously and it remains law even now. There are several reasons: First of all, the plants in the germinised areas were deprived of qualified workers because of the banishment of Germans. Besides that, several Czech foremen were discharged under the accusation of being "anti-social" (asocialove). The second reason was old and used up machine equipment, further, bad quality of after war rew-material and lack of suitable coleurs and chemical matters. Lately, lowering of quality is caused by introduction of automatic looms type "Hrdina", served in a shock-worker way, i.e. one weaver serves 120 looms. As result of this, the number of faults on 100 meters of material is five times larger than before the war. Goods with faults in weaving or irregularly coloured goods are not suitable for export and therefore are being assigned to the so called free market". It is characteristical that even in Darest where goods are being sold only for foreign currency or for gold, goods with smaller faults also appear.

Several plants are being headed by non-experts and experts are constantly being moved from one plant to another - or discharged from political reasons. Kind of production of plants is being changed without regard to suitability of machine equipment and skill of workers. In the plant at DVUR ERALOVE for instance, where forserly material for men's shirts (popline) used to be manufactured this preduction has been replaced by production of so called flimsy texture (ridge moliny) for print. The reason for this change was that the printing plants are located at DVUR ERALOVE and the fact that special locate are specially trained werears are necessary for production of popline was not taken into measurements. The final decision entocrains abolition of certain textile plants depends on the experts from metallurgic industry who chose first of all buildings suitable for the intended metallurgic production. Plants which were designed by them are being abolithed without any further respects. It is not not be shifted textile plants be required with the shifted textile plants because the shift thing is being abolithed textile plants be seen judged from the class of mechanism of the shifted textile plants the impression that only production of cartain plants. It makes the impression that only production of cartain plants which must probably will be sent for meaning established factories which must probably will be sent for meaning to the USES.

Mithia the metione) corporation Min. production of imitted goods, is a plant in Process VIII. Advisor Min Min into which important to be in Corner CHEKA Translation. The trial of metables used to be in Corner bands and of the court of wall as the employees left for Germany 1t was many to sever the smed of these articles semenor. This is done mighing knitting smedies from Cornery by special agents, under vision of SHB somewhere mear CHEB (M51/F 37). In Caechoelovakia, knitting meedles are being produced by the national corporation Igla at CESEE BUDGIOVICE(Ok9/Q 96) but as the products are not perfect, the national corporation Igla established for its use a production which works up the semi-products of Igla. This production is headed by a former employee from CESKA KAMENICE, Jarostir SEDIACKY, about 26 years old, a non-Communist and devoted democrat. As constructor, Josef SPIRAL is employed there (she was lent by Igla), a formal maist. He is supposed to instruct further workers. This plant constructs necessary machines for its use. SEMLECKY, being an expess isindispensable for the plant and therefore is being left in his leading position although he is an anti-Communist. Products of this plant are fully suitable and will replace the sauggled ones in the long run. There are disputes concerning this plant, because an effort is being exerted to separate it from Mira, to attach it to the metalluric branch of industry and transfer it to HENO where it is supposed to become part of the Metallurgic Research Institute. heally, this production is extremely important for knitting industry as the only source of suitable knitting needles, especially of the hollow needles, called "Interlock-needles".

The planned production of textile industry for 1950 has been from the beginning restricted by 20% by confidential internal orders. Flant of the different textile sections were several times changed in the owners of the year. Because of the performed abolishing of the because if the sepecity and production numbers are now sittened interest. It would be necessary to asquire not numbers for the production of textile interest.

Commence of the control of the contr

**-7-**

the planned requirements. Up to the present, some artificial silk is still being imported, mostly from Italy. In case of real need, Foland could be of help in this respect, as there also is a large production of artificial silk there.

Production of perlon, which up to the present has been reserved mostly for export, is to be doubled during the year 1951.

SEORET

# TEXTILE INDUSTRY IN THE CER.

Source estimates that a maximum of ten percent of the Czech textile production capacity is used for the output of military items such as clotning, parachutes, etc. Ten percent, source points out, is quite large when the total capacity, likewise considerable, of the CSR's textile production capacity is considered.

The Czech textile industry can never become entirely independent of the West. However, the Czech textile industry has secured independence of the West in so far as machinery is concerned for the next 20 to 30 years, according to source, by the acquisition of a machine park (sic) from western countries. A sufficient number of spinning machines have been secured from England over the past two years to meet CSR needs. The life span of a spinning machine is between 20 and 30 years, and spare parts for spinning machines are produced in the CSR.

Spinning, weaving, dressing, etc. machines used in the production of silk have been imported from England and the USA, so that Czech factories are now well supplied and will not require replacements for atleast 20 years. Prior to 1945 textile dressing machines were imported from Germany, and afterwards from England. However, the CSR now has its own factory for the afterwards from England. However, the CSR now has its own factory for the production of dressing machines at Liberec (051 Gl6). Although the Liberec product is not of as high a quality as the German and English machines, they are adequate. Other tools required by the textile industry are manufactured in the CSR.

Raw materials for the textile industry is another problem, however, and is the industry's weak point. Only two important items, cotton and linen, can be secured by the CSR in the East, both being imported from Russia. The Soviet cotton, however, can only be used in manufacturing rougher textiles. The main drawback is that Soviet cotton deliveries will be as a rule a mixture of several qualities, which in themselves, however, are not too bad, a mixture of long haired and short haired cotton, and are apt to be of varying a mixture of long haired and short haired cotton, and are apt to be of the cSR is, therefore, dependent on the West for the import of finer cotton.

Among the other critical rew materials of the textile industry are to be mentioned wool, mainly imported from Australia, jute secured from English from English firms (source does not know where it is purchased), sisal hemp from the English colonies, natural silk mostly imported via England and the USA although some is secured through France, dyes largely from Switzerland.

Other items needed as sumiliary substances by the textile industry such as impregnating, softening, egalizing agents, etc., have also been imported from the West, but they will eventually be replaced by substitutes produced in the CSR.

The stocks on hand of the above critical items which the CSR can only secure in the West are not large. If all western imports were completely stopped, these stocks could scarcely cover more than six months requirements.

STONE

\_2\_

The Soviet Union is the principal consumer of exported textile goods from the CSR, and Russia now receives more Csech textile goods than makes up the total of Western imports from the CSR. The satellites also import some of the Csech textile production, but very little. Prior to WM-II Finland imported from two to four percent of the total of Czech exports; she is still importing Czech textile exports, and source believes it is at approximately importing Czech textile exports, and source believes it is at approximately the same rate. Switzerland has been the main Western customer for Czech textile exports, mostly by way of compensation. Other customers in the Western textile exports, mostly by way of compensation. Other customers in the Western Holland, England, the USA, Canada, and North African states. Source is unable to specify the quantities imported by the above, nor can he report on the specific type of textiles imported by them. He asserts that most of the exporting of Czech textile products is handled by JUTA National Corporation which has its headquarters in Prague.

SEGNE

# VERTEX, NATIONAL COMPORATION AT HRADEC KRALOVE (051/G 71).

The seat of the management of the national corporation VERTEX is at HRADEC KRALOVE. The enterprise consists of a small factory at HRADEC KRALOVE and another factory in the vicinity of TANNWALD (Polumby - 0 51/G 36) (?). In these factories fibres and tissue of glas are produced. This production was introduced in 1949 more-or-less as a test-production. The management was located at HRADEC KRALOVE most probably because there is the gla research institute there.

It is a completely new kind of production, a Csechoslovak unique product based on successful tests done with the glas fibre and glas tissue, called "glas clip" (skelna stris). The main waw-material for this product is glas. The product serves for production of fire-proof and special textile; resistant against heat, acids and lyes, against rottening etc.

Application of these glas-textiles is still tested. However, this product is already being delivered as tissue for production of decoration material, for production of special textile goods, for production of special military cloths(air-force and tank overalls, protecting against heat and blazing-up etc.). As fibre, this product is being delivered under the name Vertex for production of insulation electrotechnical covers of cables etc. Attempts are being made for use of Vertex as substitute of so called cord (kordy) for tires.

As far as the colored material is concerned, the colored glas is not being used in production of Vertex but only the produced fibres are dyed as it is usual with other textile goods. The other finishing process is also the same as with other textile goods.

The whole production is up to the present in the state of development and tests. The product is already a perfect material but its application for several other purposes is still being tested. In both these factories work is being done on locas. The factory at Hradec Kralove employes about 180 people and the factory in the vicinity of TANNWALD (POLUENY) - ? - about 100 persons.

25X1A

# artificial Fibros Production in the CER:

Now, modern methods of production of artificial fibres are being employed in the plant at MERATOVICE (OSL PEO). Artificial fibres are also being produced at Maunit plants in the following places:

LOWESICE
Dynamit-Hobel at BRATISLAVA (P49 199)
Dynamit-Hobel at SENICE
Swit at HATISONCE (Q50 158)

The artificial fibre production of all these plants is based on cellulose. Silon, the Caschoelovak equivalent of Nylon produced by the Svit plant at BATISOVCE, is an amino fibre, which is especially used in manufacturing me stockings. Source asserts that Silon is rather better than Nylon in that it is more durable.

Viscose, a solution of cellulose nitrates, and Kantates of cellulose, cellulose dissolved in sulphide of carbon with caustic solutions, are the two fibres most produced in the CSR. Also manufactured are Acetyle - cellulose, which is cellulose combined with acetic estners, and cuprasmonium silk, which is a solution of cellulose in ammonical copper exide.

Because of a lack of wool and cotton, 30 percent to 80 percent artificial fibres are being introduced into textile goods being produced in the CSR. All four of the above products can be used as substitutes for wool after they are impregnated with albuminous substances such as caseine solution. Cupresmonium silk is the best of them for this purpose, but all of them have the shortcomings of not being wrinkle-proof and having little or no nap, are too smooth.

In addition to Silon as mentioned above, Acetyle - cellulose and cupremmonium silk are also used especially for manufacturing stockings, although the Acetyle - cellulose has the drawback of being difficult to dye. Viscose has the two shortcowings of not being durable because its nitrates are subject to rapid decomposition and of being highly inflammable.

In addition to collulose, the main raw material in the manufacture of these four substances, some woolen refuse is also utilised.

# Grecheslovek Fur Industry.

This branch of industry started in the GER from very small beginnings about 30 years ago and its largest center in the GER was MAINEMO (050/MS6) until 1940. During the World War II and especially after the large fur-production center at LEIPZIG had been bembed large orders for dressing furs for the German Arms were given to the factories in Bohemia and Moravia. For this reason, the formerly small factories were considerably enlarged during the war, and after the war several new modern factories built up. The years 1946 and 1947 were golden years of Gaechoslovak fur industry. Gaechoslovakia was supposed to take ever the important position of the former Leipzig fur industry. This supposition was supported by the fact that a great lot of fine raw-skine were imported to the GSR and products made of them exported to the Western countries.

The largest plant built at that time was at PORICI (051/694) near TRUTMOV, the owner of which was Ing. J. VIK, who formerly had his enterprises at GESKA SKALIGE (051/683). According to the original projects, this plant was supposed to be the most modern one in Europe. It was supposed to be errected for the cost of 70,000.000 Kee and was to employ 2000 people. It was incomprehensible that the owner started with realization of such a large project at the time of general nationalization, but it was said that the plant was being built with the agreement of the Minister of Industry LAUSMAN, who reportedly gave his assurance that the plant would not be nationalized. The necessary capital for this project was given partly by VIK who was allowed to use deposits bound in consequence of the currency reform in 1945 and further necessary funds were to be given by the Minister of Industry. Also J. KUDRHAG, owner of the nationalized rubber factory at MAGNOD (051/645), took part on this enterprise.

This industry was not touched by the first nationalization. After the February 1946 coup, all the enterprises were given where national administrators were the fermer owners. The fur industry was attached as a separate section to the Glechoslovak Textile interprises and as enterprise manager of this section was nominated the fermer owner of the enterprise "Braxtri Kromarove" in 1980, Inc. Alais Kirkel, who was a devoted Gemmunist and whose wife was chairman of the Memon Council for Brue county, At the end of 1948, the national administrations were abolished and the whole section of industry was nationalized. (The national administrations were introduced according to the edict about complete nationalization of the fur industry.) A new manager was assigned to each enterprise and the former puners were transferred to the enterprise management the seat of which

- 2 -

at that time was in FRAGUE. J. VIK who was arrested immediately after February 1946 was released after a few months as undispensable and used the first eppertunity to escape abroad. His former enterprise at PCRIGI was being built further, of course not in the formerly intended dimension. (It was formerly supposed to be an industrial center similar to ZhIH, including a social house, living strial center similar to ZhIH, including a social house, living

In the half of the year 1949 great disputes started between the Greshoelovak textile enterprises (GTZ) and the Greshoelovak Leather and Rubber Enterprises (CZEG) - former RATA) on the question whether fur is to fall under the textile section (some experts stated that fur was a part of clothing) or under the leather section (some experts stated that the two branches of industry are very similar). The final result was that the national corporation was divided into two branches: The first-production - where, those plants which are employed with dressing and dying of fur were attached - became part of the beather and Rubber Enterprises, and those factories which make parts of clothing of fur were left with the textile enterprises Those plants which were employed with both kinds of this production, were deprived of one part of it. This divisions of the fur industry was done under the strong influence of the General Manager of Leather and Rubber Enterprises Dr BOLY in the Party. He had special interest on the fur industry because of its prosperity and financial profits as well as of his personal dislike for Ing. KRCMAR.

There were altogether 12 of the first-production factories which were united under the name KOTOV, national corporation, factories for preparation, dying and dreshing of fur. KOTOV was formed from the following plants: J.VIK, PORICI near TRUTNOV, J.VIK, CESKA SKALICE (80 employees), L. MORAVEC, PISEK (M50/Q69), "BOSTON", owner J.VANEK, EREZHRAD (051/070) near HRADEC KRALCVE (40 employees), J. HOLICKY, KUMRATICE (051/L87) near PRAGUE (100 employees), "LUSTRA", owner K. PISKO, PRAGUE VIII (60 employees), Ing. Josef HANUS, MLIMSKO (60 employees), MRATRI ERCHAROVE, MRMO (50 employees), PAMLOUSEK, ERMO (50 employees), JAMDERA, EREZOVA near SVITAVY (P50/E26) (20 employees). The smaller dressing and dying work-ships, the center of which was at MRAHOUS HAD LABOR (051/L99) and at STRAZNICE (P49/TO7) (about tan shops employing all of them about 120 people) were abolished immediately after mationalizations.

The seat of the enterprise management of the national corporation XOTOV was located in the plant PORIGI near THEIROV which was designed as the fundamental plant ("sakladni savod") at the same time. This plant was partly finished at that time. Until 12 Fall 1950 the This plant was partly finished at that time. Until 12 Fall 1950 the total cost assembled to 140,000.000 Kes. Also five living houses for tetal cost assemblished in the close wielnity of the factory.

The Grechoslovak heather and Rubber Enterprises assigned immediately their people to the leading positions in the enterprise. They are no experts at all and knew nothing about the production but they are devoted and indostrinated 6.7. members. As the enterprise manager one Jiri DOUBA was appointed, a fermer leather dresses who after 1945 was assigned liquidator into the textile industry. (Because he performed his talk excellently he was rewarded by being assigned to the fur branch and after its successful abeliahment he has been assigned section manager of glove-production where he again is in charge of abloishment of several factories). Fou Zalight was assigned technical manager. He is a Gemmunist, an non-expert. Security Officer was fru PAJSERT, a Communist, an unintelligent man. Chairman of the G . P. enterprise organisation was Bretislay MAJOR, about 22 years old, skill led fur-dresser, a devoted Communist. As head of the cadre department was mominated the former dust-man J. BLAVATY, about \$4 years old, a devoted Communist (an extremely unintelligent man). As the above mentioned technical manager does not understand the job, the former operational manager at CESKA SKALICE, Dr. VRBACKY, a chemist and aver age expert (in 1950 he was held on jail for about a helf a year for unknown reasons) was left in the enterprise as well as the former owner of the enterprise at MLINSKO, Ing. Josef HANUS, who is a good emert.

In consequence of the introduction of the BATA administration system into national corporation, which is in principle centralistic, a hypertrophy of the administrative organs resulted and thus abolishment of some plants necessarily had to take place. On the other hand, this abolishment was also ordered by "POP" (Industry, trade and finance - section of the G.P. Gentral Committee). "ECTOV" performed the abolishment se quisokly that within one half a year only the basic enterprise at PCHIOI remained with its branch-plant at MALICE. The liquidation was dese in such a harry that the machinery has transported from one abolished plant into another, the mounting of the machines there started and before this was finished, the abolishment of that plant was ordered again. This cause a great chaos married that plant was processed again. This cause a great chaos married and machinery were broken and the major several parts of equipment and machinery were broken and the major ity of machines were then given to serup material. A large part of this machinery was purchased after the war in the Wak and in Swedon As far as the buildings of the abolishmed plants were suitable, they were takes over by 1999, matically expertise for the use of material against this supportion from part of the exployed of 1999. ecodition of 70% reverport. The auxiliary chemical matters are all of home origin, only amiline ages have to be imported from Switzerland or VSA.

Those plants deadling with tailoring the ready made furs were attached to the "seehoslovak Texpile enterprises. Energy were about six of them and the largest were: IRIS, Pregue, BERAN, Prague, TIGEK, Ellnsko, ERDE, Straines, etc. The firm IRIS errected a new modern plant after the WW II at STARY KORIN (051/MAS). There also first-production was established which after the divisation of fur industry was abolished and only the tailoring of ready made furs was left there. This plant at STARY KOLIN became the basic anterprise of the national corporation at STARY KOLIN became the basic anterprise of the national corporation at STARY KOLIN became the basic anterprise of the national corporation at STARY KOLIN became the basic anterprise of the national corporation at STARY KOLIN became the basic anterprise of the national corporation was located "KARA" and also the management of the national corporations. As manager entered was nominated from KVARHICKA, a devoted Gommuniet and no ger general was nominated from KVARHICKA, a devoted Gommuniet and no expert. KARA abolished only the small and unimportant plants but the majority of plants were left and they etill are under operation.

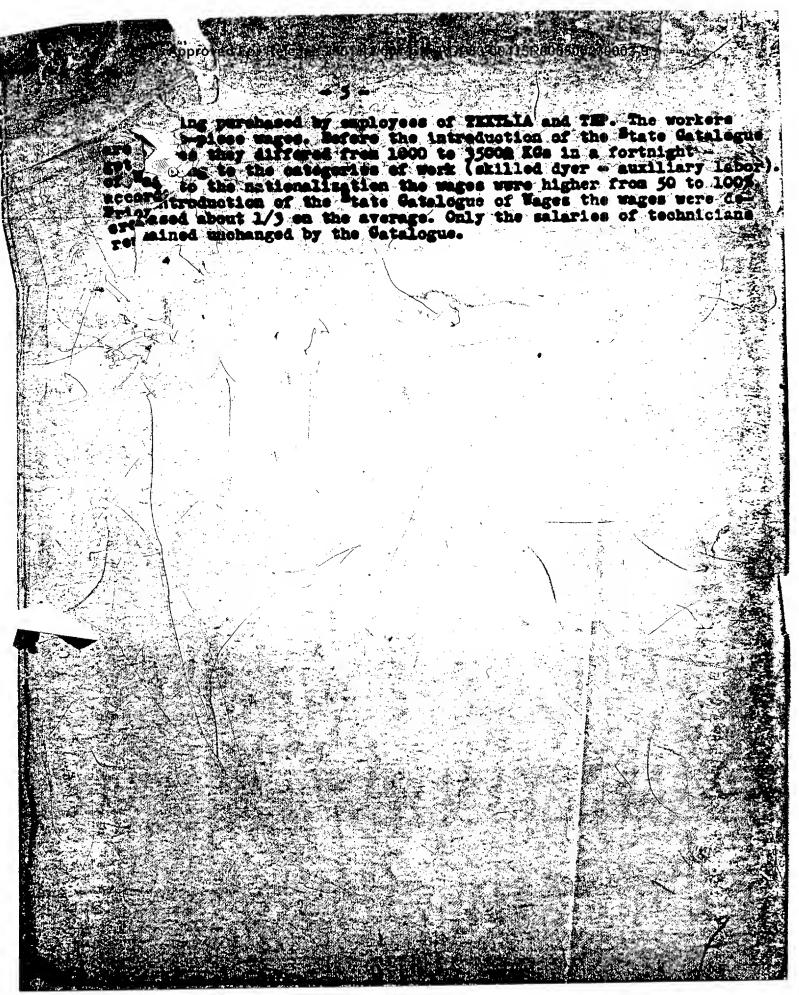

The last large export order came from Poland - for production of sheep fur-coats (most probably for the army). Further stripes were made of coloured sheep fur (so called "veloure") which were exported to America.

In result of removal of all experts from this branch of industry the quality of products is very bad and there are thousands! worth of goods which are for no use at all being compeletely spoiled. KOTOY, national corporation as first-production delivers its products to national corporation which prepares from them ready-made coats.

KARA, national corporation, selle its products to TEXTILIA, national corporation. Manager of the national corporation TEXTILIA is Rudolf SQHIFF, who lives in PRAGUE XII, Bradecka 22. He is a former employed of a fur-shop, an expert, who liquidated several fur-wholesales in Michaleka street in PRAGUE (that was the center of the fur-trade). It is a devoted Germanist of far-reaching influence in the ESO. He avoid Party functions but he is one behind the seenes who gaves different instructions and advices. He is a Rumanian Jew by origin, who mysteriously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the so called riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace by the Germans at the time of the second riously was left in peace and riously was left in peace at the time of the second riously was left in the second r

The national corporation TEXTILIA distributes the fur-preducts among the sale-shope of TES, national corporation, Therefrom it can be purchased by sustances.

This chall could be a far as they are destined for the home-market,
